My final gripe is with the PDF creation process. While there were some important changes, I wish the export process had been a bit simpler for a user who wants to retain their work in a structured manner, because Adobe's approach is a bit 'all in the head' at the moment. It would have made a better conceptual link have said "Adobe PDF Creator" and saved you from an extra click. Instead, you can just create a new PDF out of a specific selection, which should be far more useful, considering most people don't want to start from scratch. In other words, if you have a lightroom catalog, you will no longer be able to go back to individual images in one click. You will have to export each image individually instead. In addition, what even is a "temporary" file? Can it really be temporary if you have to ask for an export of the single image every time you want to create a new PDF file? In the end of the day, this seems like a very minor gripe. The problem comes when lightroom is completely cloned, the number of users explodes, and Photoshop, because of its complexity, becomes redundant. In other words, we are not looking at an evolution of "creative tools" but rather an evolution of a content management system, which is a very, very bad sign. The Fujifilm X-Trans RAW files that Lightroom 5 now handles are so impressive that I strongly recommend trying them, especially if you're a Fujifilm X-Trans fan. To test them out, I innocently went to the Fujifilm web site to download the Fuji X-T-1 and the corresponding camera software that allows for Capture One to make a host of adjustments, including the addition of noise reduction. While I was there, I also looked for a patch file to be able to set up Lightroom to work with Fujifilm X-Trans RAW files. For some reason, Lightroom was not finding the file on the Fujifilm website, so I was left with manually adding a Capture One and Lightroom plugin that would allow me to migrate my RAW images from the X-Trans to Lightroom.

The keynote gave a good insight into the workings of Vision AI, which powers Face ID, Animoji, Apple's filters in iOS and all the digital services (such as AI in Siri and Photos) on the desktop.
